

AS 3600—2001
(Incorporating Amendment No. 1
and Amendment No. 2)

AS 3600—2001

Australian Standard™

Concrete structures

This Australian Standard was prepared by Committee BD-002, Concrete Structures. It was approved on behalf of the Council of Standards Australia on 11 April 2001.

This Standard was published on 5 June 2001.

The following are represented on Committee BD-002:

AUSTROADS
Australian Building Codes Board
Australian Pre-Mixed Concrete Association
Bureau of Steel Manufacturers of Australia
Cement & Concrete Association of Australia
Concrete Institute of Australia
Curtin University of Technology
Institution of Engineers Australia
Master Builders Australia
National Precast Concrete Association Australia
Steel Reinforcement Institute of Australia
The Association of Consulting Engineers Australia
The University of Adelaide
The University of Melbourne
The University of New South Wales
The University of Western Sydney

Keeping Standards up-to-date

Standards are living documents which reflect progress in science, technology and systems. To maintain their currency, all Standards are periodically reviewed, and new editions are published. Between editions, amendments may be issued. Standards may also be withdrawn. It is important that readers assure themselves they are using a current Standard, which should include any amendments which may have been published since the Standard was purchased.

Detailed information about Standards can be found by visiting the Standards Web Shop at www.standards.com.au and looking up the relevant Standard in the on-line catalogue.

Alternatively, the printed Catalogue provides information current at 1 January each year, and the monthly magazine, *The Global Standard*, has a full listing of revisions and amendments published each month.

Australian Standards™ and other products and services developed by Standards Australia are published and distributed under contract by SAI Global, which operates the Standards Web Shop.

We also welcome suggestions for improvement in our Standards, and especially encourage readers to notify us immediately of any apparent inaccuracies or ambiguities. Contact us via email at mail@standards.org.au, or write to the Chief Executive, Standards Australia International Ltd, GPO Box 5420, Sydney, NSW 2001.

AS 3600—2001
(Incorporating Amendment No. 1
and Amendment No. 2)

Australian Standard™

Concrete structures

Originated as part of AS A26—1934, AS CA2—1934 and MP 13—1957.
Previous edition AS 3600—1994.
Third edition 2001.
Reissued incorporating Amendment No. 1 (May 2002).
Reissued incorporating Amendment No. 2 (October 2004)

PREFACE

This Standard was prepared by Standards Australia Committee BD-002, Concrete Structures, to supersede AS 3600—1994.

This Standard incorporates Amendment No. 1 (May 2002) and Amendment No. 2 (October 2004). The changes required by the Amendment are indicated in the text by a marginal bar and amendment number against the clause, note, table, figure or part thereof affected.

Objective of the Standard

The principal objective of the Standard is to provide users with nationally acceptable unified rules for the design and detailing of concrete structures and elements, with or without steel reinforcement or prestressing tendons, based on the principles of structural engineering mechanics. The secondary objective is to provide performance criteria against which the finished structure can be assessed for compliance with the relevant design requirements.

Background to the Third Edition

Amendment No. 1 to the 1994 edition of the Standard was issued in August 1996 to take account of the low ductility of wire to AS 1303 and mesh to AS 1304. It also incorporated improvements based on user experience in implementing AS 3600.

Following a five-year review, further amendments to the Standard were approved by the Concrete Structures Committee in August 1999. These amendments take account of more recent revisions of key materials Standards, and incorporate additional improvements to the clarity and intent of particular requirements, based on user comments.

In view of the number and extent of the amendments to AS 3600 now involved, the SAI Concrete Structures Committee recommended that, rather than issuing further 'green slip' amendments, a Third Edition of AS 3600 be published which incorporated all published and approved amendments, Amendment 1 and 2.

Differences between the Second and Third editions of AS 3600

As noted in the opening paragraphs of the Preface, this Edition incorporates Amendment No. 1 of August 1996 and amendments approved in August 1999.

Areas of major change covered in Amendment 2, which have been incorporated into this edition, are as follows:

- 1 Introduction of 500 MPa reinforcing steel with AS/NZS 4671 covering the specification for the new grade of reinforcing steel. The carbon equivalent of the reinforcement has been held to a level so that current practices for site welding of reinforcement including 'locational tack welding' can continue to be used.
- 2 Increase in the maximum concrete compressive strength to 65 MPa.
- 3 Consistency of references and information within AS 1379—*Specification and supply of concrete*, including a change to the basic shrinkage strain value to reflect normal class concrete.
- 4 Fire-resistance periods for the structural adequacy for columns has been revised following research by BRANZ, and allowances for chases and recesses in concrete walls have been included and are consistent with those in AS 3700, *Masonry structures*.
- 5 Linear elastic analysis requirements have been reviewed with consideration of propping, effective stiffness, secondary effects and moment redistribution.

- 6 Beam strength and serviceability design requirements have been significantly reviewed with changes to the minimum strength requirements, deflection by simplified calculation, the deemed to comply span-to-depth ratios, crack control provisions and end anchorage of fitments among others. The maximum transverse bar spacing have also been increased.
- 7 Changes have been made to the rules for flexural crack control of slabs, including reduction of the maximum transverse bar spacing.
- 8 Development length and splicing of reinforcement has been revisited and include amendments to the deemed to comply lengths and the size of bars permitted in tension and compression lapped splices. Rules for welded and mechanical splices have been removed and new rules are under development.
- 9 Material requirements have been updated with reference to the current AS 1379 and the new reinforcing steels to AS/NZS 4671.
- 10 Section 20 has been deleted in its entirety, with all aspects of the testing and assessment of concrete referred to AS 1379.
- 11 Section 21, on the testing of members and structures, has been completely redrafted and relabelled as Appendix B.

The Committee is in the process of a major revision of AS 3600, which includes the areas of high-strength concrete, bond and anchorage requirements and application of mechanical and welded splices.

The terms ‘normative’ and ‘informative’ have been used in this Standard to define the application of the appendix to which they apply. A ‘normative’ appendix is an integral part of a Standard, whereas an ‘informative’ appendix is only for information and guidance.
